

#### Pol Bio-Image Analysis Symposium 2023 Training School Early Career Track

## Introduction to Napari

Marcelo Leomil Zoccoler

With material from:

Robert Haase, PoL; Guillaume Witz, Universität Bern

#### Napari: 3D viewer for Python

Multi-dimensional image viewer in python

which distribution to install

napari https://napari.org/ colormap: rendering: interpolation: a napari.org/index.html napari Image multi-dimensional image viewer for python napari napari is a fast, interactive, multi-dimensional image viewer for Python. It's designed for browsing, Q Search annotating, and analyzing large multi-dimensional images. It's built on top of Qt (for the GUI), vispy (for performant GPU-based rendering), and the scientific Python stack (numpy, scipy). We're developing **napari** in the open! But the project is in an **alpha** stage, and there will still likely be breaking changes with each release. You can follow progress on this repository, test out new versions Tutorials as we release them, and contribute ideas and code. Plugins We're working on tutorials, but you can also quickly get started by looking below. Release notes API reference installation Image [0 0]: [154, 147, 151] Roadmaps Developer guides

```

ax[0].imshow(image, cmap = 'gray')
ax[1].imshow(mask, cmap = 'gray')

In [10]: fig, ax = plt.subplots(1,2)

#### Why using notebooks?

Keep all the benefits from using code:

- Batch processing

- Running python functions/tools still unavailable as plugins

#### Why using notebooks with napari?

- Easy data interaction and visualization with napari:

- Great for visualizing 3D (and more) data

- Each processing step result can be displayed as a separate layer

- Data annotation

### Opening napari

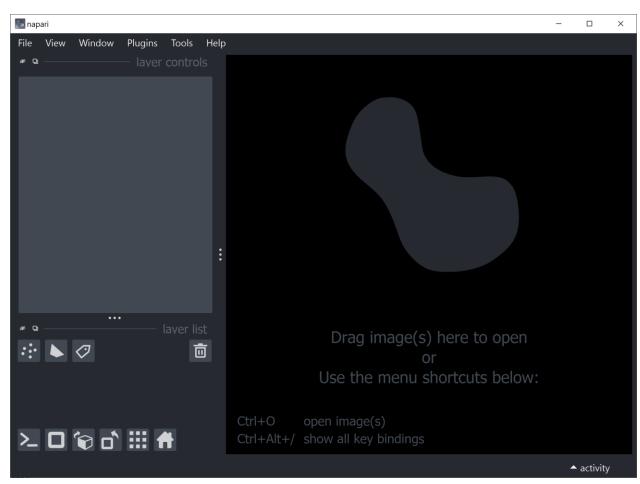

From command line:

From code (jupyter notebook):

```
[1]: import napari
[*]: viewer = napari.Viewer()
[ ]:
```

#### Opening Images in napari

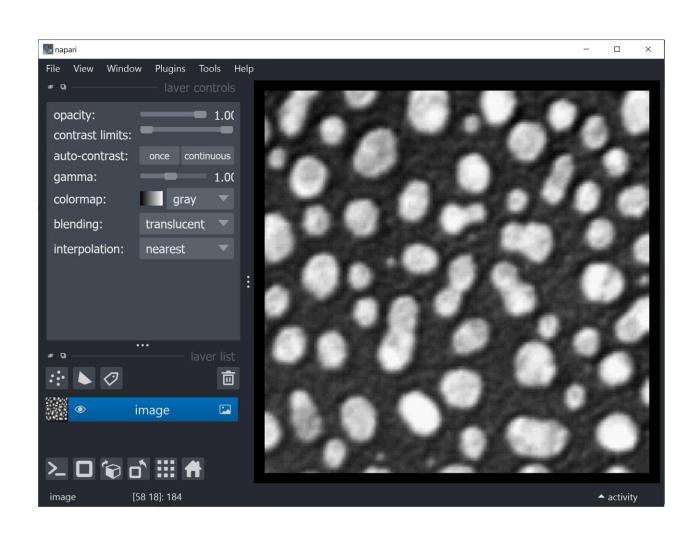

- Drag and drop
- File > Open File...
- From code:
  - Open an image with an "imread" function

```
image = imread("image.tif")
```

Load the image to the viewer

```
viewer.add_image(image)
```

#### Scripting napari in notebooks

 Add layers to napari to visualize intermediate processing results on top of each other or side by side.

Change layer visualization within napari...

... or via code in a jupyter notebook:

viewer.layers[0].contrast\_limits

[0, 255]

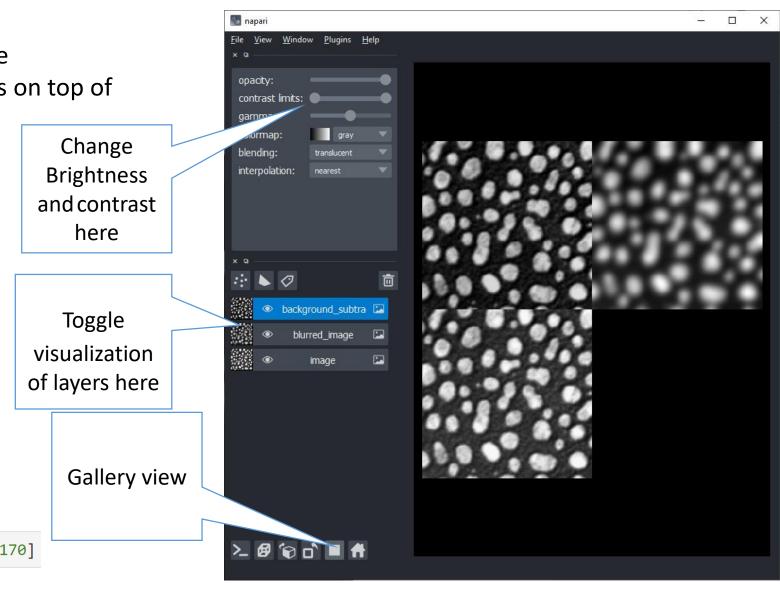

1. Access the viewer

2. Access the layers

3. Choose a layer (by index or name)

4. "Press TAB" and check out available properties

viewer.layers[0].contrast\_limits = [30,170]

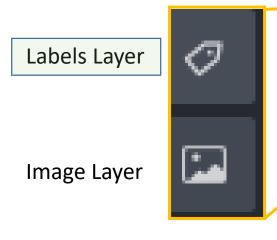

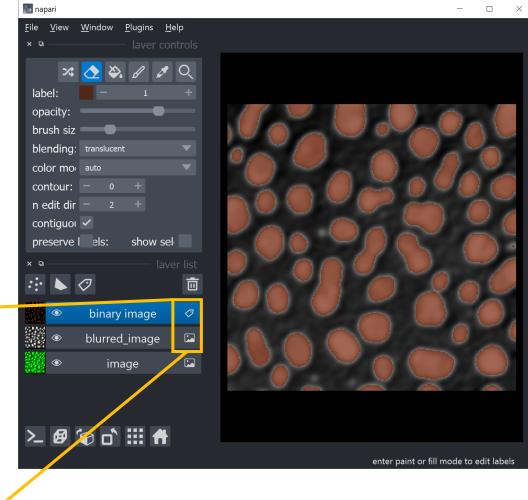

#### Visualizing image segmentation

- Binary images and label images visualized as label layers
- # Add a new labels layer containing an image
- viewer.add\_labels(binary\_image,
- name="binary image")

Name your layers to keep track of what they contain

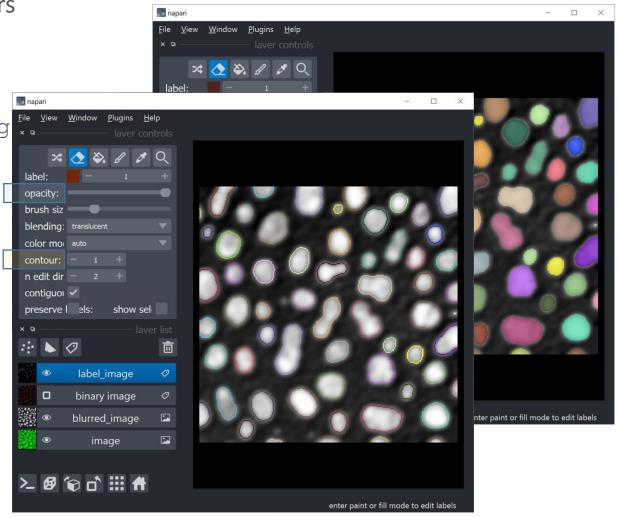

#### Visualizing image segmentation

Binary images and label images visualized as label layers

- # add labels to viewer
- label\_layer = viewer.add\_labels(label\_imag ...
- Visualize contours instead of the overlay
- label\_layer.contour = 1
- label\_layer.opacity = 1

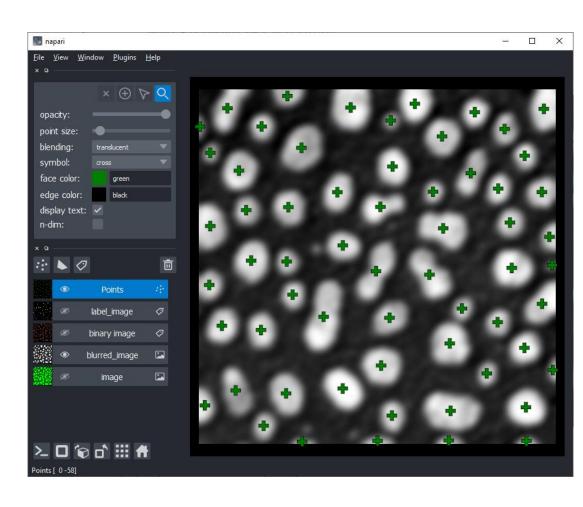

#### Points layers

- There is also other layer types
  - Shapes
  - Points
  - Surfaces
  - Tracks
  - Vectors

```
# add points to viewer
label_layer = viewer.add_points(points,
  face_color='green', symbol='cross', size=5)
```
